PATIENT NUMBER:

652

REFERRING PHYSICIAN:

FERSEL JORDAN

MRI OF THE LEFT SHOULDER WITHOUT CONTRAST

HISTORY: Patient was involved in an accident on 09/13/2021 and complains of pain.

COMPARISON: None.

TECHNIQUE: MRI of the left shoulder was performed using T1 and T2 weighted sequences in multiple planes.

FINDINGS:

Subtle hyperintense signal is seen in the terminal portion of supraspinatus tendon on T1 weighted images, suggestive of tendinosis. Other rotator cuff tendons appear unremarkable. There is no evidence of tendon tear.

Minimal synovial effusion is seen. Minimal fluid is seen in subacromial – subdeltoid bursae.

A small lesion, appearing hypointense on T1 and hyperintense on T2 weighted images is seen in humeral head. This is likely to represent non-specific cyst.

The alignment of the shoulder joint is normal. The bones around the shoulder joint reveal normal intensity.

The gleno-humeral joint is normal. There is no evidence of erosion or destruction of articular cartilage. The articular margins are intact.

The glenoid labrum is normal. The acromio-clavicular joint also appears normal.

The muscles and their attachments also appear normal. Major neurovascular bundles are normal.
