JeaC7047

## LEFT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Left shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the left shoulder was performed without intravenous contrast.

**COMPARISON**: None available.

### FINDINGS:

ROTATOR CUFF: There is supraspinatus, infraspinatus, and subscapularis tendinitis. There is no rotator cuff tear. There is subdeltoid/subacromial bursal thickening and edema in keeping with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: There is mild acromioclavicular joint disease. There is an anteriorly curved acromion which contributes throughout the cuff impingement.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a tear at the base of the posterior superior glenoid labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: There is diffusely heterogeneous and T1 depressed marrow signal which is likely related to a hematologic dyscrasia. Recommend correlation with lab values.

NEUROVASCULAR STRUCTURES: Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

#### IMPRESSION:

Diffusely heterogeneous and T1 depressed marrow signal which is likely related to a hematologic dyscrasia. Recommend correlation with lab values.

Tear of posterior superior glenoid labrum.
