MRI RIGHT SHOULDER

Exam Date: 05/20/2022 3:51 PM

Accession: 24971

Patient Name: Lawry, Leon

06/03/1984

DOB: Gender:

00/03

MRN:

LawL5194

RIGHT SHOULDER MRI WITHOUT CONTRAST

HISTORY: Right shoulder pain status post motor vehicle accident

TECHNIQUE: Multiplanar, multi-sequence MRI of the right shoulder was performed without intravenous contract

intravenous contrast.

COMPARISON: None available.

FINDINGS:

ROTATOR CUFF: There is an interstitial tear at the attachment of the infraspinatus tendon. There is supraspinatus and infraspinatus tendinitis. There is subdeltoid/subacromial bursal edema consistent with bursitis.

MUSCLES: No muscle edema or fatty muscle atrophy.

AC JOINT: Intact. There is an anteriorly curved acromion which contributes to rotator cuff impingement.

BICEPS TENDON: Intact long head of the biceps tendon.

LABRUM/LIGAMENTS: There is a 9 x 5 mm paralabral cyst adjacent to the posterior superior glenoid with a suspected tear of the adjacent labrum.

GLENOHUMERAL CARTILAGE: Intact articular cartilage.

SYNOVIUM/JOINT FLUID: No joint effusion or synovial thickening.

MARROW: Normal marrow signal.

NEUROVASCULAR STRUCTURES; Normal in course and caliber.

PERIPHERAL SOFT TISSUES: Normal.

IMPRESSION:

Interstitial tear at the attachment of the infraspinatus tendon superimposed on infraspinatus and supraspinatus tendinitis. Evidence of rotator cuff impingement secondary to anteriorly curved acromion. Associated subdeltoid/subacromial bursitis.
