MRI OF THE RIGHT SHOULDER WITHOUT CONTRAST

INDICATION: Right shoulder pain

COMPARISON: No prior study was available for comparison at the time of dictation.

TECHNIQUE: T1, T2, and PD, axial, coronal, and sagittal sequences were obtained.

FINDINGS:

No fracture or suspicious lesion. No os acromiale or intra-articular loose body. Moderate hypertrophic osteoarthrosis of the AC joint with lateral downsloping of the distal acromion with acromiohumeral space measurement of 7 mm. No evidence of significant glenohumeral compartment arthritis. The glenohumeral cartilage is grossly intact.

Tendinosis supra, infraspinatus and subscapularis tendon with mild fraying. No high-grade tear or retraction. The delayed teres minor tendon is normal. No evidence of muscle atrophy or fatty infiltration.

Intact labrum.
Intact biceps tendon and bicipital labral anchor complex.

The inferior glenohumeral ligament is intact.

No significant effusion. Minimal subacromial/subdeltoid bursitis.

IMPRESSION:

1. Moderate AC arthrosis with lateral downsloping of the distal acromion with acromiohumeral space measuring 7 mm with a small subacromial subdeltoid bursitis.

2. Tendinosis supra and infraspinatus with bursal and articular surface fraying.

3. Tendinosis subscapularis.
